Subject: New sight glass with float**Description:**

According to customer feedbacks, when certain refrigerant oils are applied, it is not easy to observe the oil level through current sight glasses. To avoid this problem and make observation more convenient, we hereby announce we will apply new sight glass with float. The features of new sight glass are:

1. There is a float in the sight glass and in the back of sight glass is a damper shield. The float will always be in the space between surface glass and the damper shield.
2. When there is oil inside of the compressor, the float will always be on the surface of oil level and help observe oil level.

Photographs of new sight glass:**Photographs of original sight glass:****Phase-in schedule**

The new sight glass will be used from 2012. Our sales representative will inform you when starting using it in your PO. Please don't hesitate to let us know if you have any questions.
