MCS-MODBUS-IO

GETTING STARTED USER MANUAL

(Firmware Version 3.01-W or higher)

MCS-MAGNUM-N-12

SLAVE - VFD

Communicating
between
MCS-MAGNUM,
MCS-MODBUS and
VFD or other slaves

MCS-MODBUS IO-12

**MCS Total
Solution
for all your
Control
Needs**

**See Appendix section in back of
Manual for quick steps for
MCS-MODBUS-IO-12 functions**

Energy Efficient and RoHS Compliant

The MCS Commitment is to provide practical solutions for the industries needs and to be both a leader and partner in the effective use of microprocessor controls.

Table of Contents

Chapter - 1. Introduction to ModBus Protocol	9
1.1. What is Modbus Protocol?	9
1.2. What is it used for?	9
1.3. RTU MODE	9
1.4. RTU Framing	9
1.5. How the Address Field is Handled	10
1.6. Modbus Protocol	10
1.7. How the Function Field is Handled	11
1.8. What is a function code?	11
1.9. Modbus “Registers”	11
1.10. Exception Errors	12
1.11. What is a Modbus Map?	12
Chapter - 2. MCS-MODBUS-IO-12 Communication	13
2.1. Communicating with MCS-CONNECT	13
Chapter - 3. Program Type Preprogram Select Settings	15
Chapter - 4. USER Custom Programming Switch ‘9’	16
4.1. SETTING UP CUSTOM PROGRAM FOR YOUR DEVICE	16
4.1.1 Data Input	16
4.1.2 Service Panel-MODBUS CONNECTION SETUP - MCS-CONNECT	16
4.1.3 Read Sensor Inputs	17
4.1.4 Write Analog Outputs	18
4.1.5 Write Relay Outputs	18
4.1.6 Write General Outputs	19
4.1.7 Once you have completed the ‘USER CUSTOM SETUP’	19
4.1.8 LOAD THE NEW .CFG FILE TO YOUR MODBUS	20
Chapter - 5. MCS-MAGNUM - Modbus Typical Network	21
5.1. A typical network layout will consist of the MASTER and slaves.	21
Chapter - 6. MCS-MODBUS-IO-12 BOARD	22
Chapter - 7. Wiring Diagrams	23
7.1. Wiring MCS-MAGNUM I/O for communicating	23
7.2. Wiring to MCS-MAGNUM with MCS Expansion Board	24
7.3. Wiring from Power Supply, MCS Controller, MCS-Modbus, to Modbus Slave	25
Chapter - 8. Pre-Programmed for Slave Devices	26
8.1. Yaskawa GA800/A1000 HARDWIRED Mapping Details (Hardwired and Modbus)	26
PROGRAM SELECT ‘0’	26
8.1.1 Yaskawa GA/800/A1000 MCS-MODBUS ONE-TIME WRITES - INSTALLATION	26
8.1.2 Yaskawa GA800/A1000 MCS-MODBUS Communication Setup	26
8.1.3 Yaskawa GAS800/A1000 MODBUS Read Sensor Inputs	26
8.1.4 Yaskawa GA800/A1000 MODBUS Write Analog Outputs	27
8.1.5 Yaskawa GA800/A1000 Write Relay Outputs	27
8.1.6 Yaskawa GA800 / A1000 Setup for MCS-Modbus I/O	28
8.1.7 MCS-MAGNUM YASKAWA GA800/A1000 VFD SENSOR INPUT CONFIGURATION	29
8.1.8 MCS-MAGNUM - YASKAWA GA800/A1000 VFD Analog Output	30
8.1.9 3 MODBUS WRITE SCREENS (yellow)	30
8.1.10 YASKAWA GA800 / A1000 MODBUS- I-O Wiring/Points	31
8.2. TURBOCOR Mapping - PROGRAM SELECT ‘1’	32
8.2.1 TURBOCOR MCS-MODBUS ONE-TIME WRITES - INSTALLATION	32
8.2.2 TURBOCOR MCS-MODBUS Communication Setup	32
8.2.3 TURBOCOR MODBUS Read Sensor Inputs	32
8.2.4 TURBOCOR MODBUS Write Analog Outputs	33
8.2.5 TURBOCOR Write Relay Outputs	33

8.2.6	TURBOCOR Setup for MCS-Modbus I/O.....	34
8.2.7	MCS-MAGNUM TURBOCOR Sensor Inputs (13)	35

Chapter - 1. Introduction to ModBus Protocol

1.1. What is Modbus Protocol?

Modbus is a serial communication protocol. In simple terms, it is a method used for transmitting information over serial lines between electronic devices. The device requesting the information is called the Modbus Master and the devices supplying information are Modbus Slaves. In a standard Modbus network, there is one Master and up to 247 Slaves, each with a unique Slave Address from 1 to 247. The Master can also write information to the Slaves.

1.2. What is it used for?

The **MCS-MODBUS-IO-12** gives the MCS-MAGNUM the ability to act as a Modbus Master using the Modbus RTU Protocol. This allows the MCS-MAGNUM to communicate to Modbus slave devices (such as Variable Frequency Drives, Compressors, etc.) to send and access parameters from the slave devices.

The MCS-MODBUS-IO-12 performs like a MCS-RO10 and MCS-SI16-AO4 to the MCS-MAGNUM. This allows the MCS-MAGNUM to control 10 relays, 4 analog outputs and read 16 sensors.

Multiple MCS-MODBUS-IO-12 boards may be connected to the MCS-MAGNUM following MCS-I/O standards.

MCS-MODBUS-IO-12 has the capability to be configured over MCS-Connect to communicate with any Modbus slave devices that support Modbus RTU Protocol.

By using the MCS-MODBUS-IO-12 in your control system, the MCS-Magnum is able to collect data points from the Modbus device and the user can view these data points using MCS-Connect.

1.3. RTU MODE

When controllers are setup to communicate on a Modbus network using RTU (Remote Terminal Unit) mode, each 8-bit byte in a message contains two 4-bit hexadecimal characters. The main advantage of this mode is that its greater character density allows better data throughput than ASCII for the same baud rate.

Each message must be transmitted in a continuous stream.

The format for each byte in RTU mode is:

Coding System:	8-bit binary, hexadecimal 0–9, A–F
	Two hexadecimal characters contained in each 8-bit field of the message
Bits per Byte:	1 start bit
	8 data bits, least significant bit sent first
	1 bit for even/odd parity; no bit for no parity
	1 stop bit if parity is used; 2 bits if no parity
Error Check Field:	Cyclical Redundancy Check (CRC)

1.4. RTU Framing

In RTU mode, messages start with a silent interval of at least 3.5 character times. This is most easily implemented as a multiple of character times at the baud rate that is being used on the network (shown as T1–T2–T3–T4 in the figure below). The first field then transmitted is the device address.

The allowable characters transmitted for all fields are hexadecimal 0–9, A–F. Networked devices monitor the network bus continuously, including during the 'silent' intervals. When the first field (the address field) is received, each device decodes it to find out if it is the addressed device.

Following the last transmitted character, a similar interval of at least 3.5 character times marks the end of the message.

A new message can begin after this interval.

The entire message frame must be transmitted as a continuous stream. If a silent interval of more than 1.5 character times occurs before completion of the frame, the receiving device flushes the incomplete message

and assumes that the next byte will be the address field of a new message.

Similarly, if a new message begins earlier than 3.5 character times following a previous message, the receiving device will consider it a continuation of the previous message. This will set an error, as the value in the final CRC field will not be valid for the combined messages. A typical message frame is shown below.

START	ADDRESS	FUNCTION	DATA	CRC CHECK	END
T1-T2-T3-T4	8 BITS	8 BITS	n x 8 BITS	16 BITS	T1-T2-T3-T4

Figure 4 RTU Message Frame

1.5. How the Address Field is Handled

The address field of a message frame contains eight bits (RTU). Valid slave device addresses are in the range of 0 – 247 decimal. The individual slave devices are assigned addresses in the range of 1 – 247. A master addresses a slave by placing the slave address in the address field of the message. When the slave sends its response, it places its own address in this address field of the response to let the master know which slave is responding.

Address 0 is used for the broadcast address, which all slave devices recognize. When Modbus protocol is used on higher level networks, broadcasts may not be allowed or may be replaced by other methods. For example, Modbus Plus uses a shared global database that can be updated with each token rotation.

1.6. Modbus Protocol

If the slave device takes the requested action without error, it returns the same code in its response. If an exception occurs, it returns:

1000 0011 (Hexadecimal 83)

In addition to its modification of the function code for an exception response, the slave places a unique code into the data field of the response message. This tells the master what kind of error occurred, or the reason for the exception.

The master device's application program has the responsibility of handling exception responses. Typical processes are to post subsequent retries of the message, to try diagnostic messages to the slave, and to notify operators.

- **Contents of the Data Field**

The data field is constructed using sets of two hexadecimal digits, in the range of 00 to FF hexadecimal. These can be made from a pair of ASCII characters, or from one RTU character, according to the network's serial transmission mode.

The data field of messages sent from a master to slave devices contains additional information which the slave must use to take the action defined by the function code. This can include items like discrete and register addresses, the quantity of items to be handled, and the count of actual data bytes in the field.

For example, if the master requests a slave to read a group of holding registers (function code 03), the data field specifies the starting register and how many registers are to be read. If the master writes to a group of registers in the slave (function code 10 hexadecimal), the data field specifies the starting register, how many registers to write, the count of data bytes to follow in the data field, and the data to be written into the registers.

If no error occurs, the data field of a response from a slave to a master contains the data requested. If an error occurs, the field contains an exception code that the master application can use to determine the next action to be taken.

The data field can be nonexistent (of zero length) in certain kinds of messages. For example, in a request from a master device for a slave to respond with its communications event log (function code 0B hexadecimal), the slave does not require any additional information. The function code alone specifies the action.

1.7. How the Function Field is Handled

The function code field of a message frame contains two characters (ASCII) or eight bits (RTU). Valid codes are in the range of 1 – 255 decimal. Of these, some codes are applicable to all Modicon controllers, while some codes apply only to certain models, and others are reserved for future use.

When a message is sent from a master to a slave device the function code field tells the slave what kind of action to perform. Examples are to read the ON/OFF states of a group of discrete coils or inputs; to read the data contents of a group of registers; to read the diagnostic status of the slave; to write to designated coils or registers; or to allow loading, recording, or verifying the program within the slave.

When the slave responds to the master, it uses the function code field to indicate either a normal (error-free) response or that some kind of error occurred (called an exception response). For a normal response, the slave simply echoes the original function code. For an exception response, the slave returns a code that is equivalent to the original function code with its most-significant bit set to a logic 1.

For example, a message from master to slave to read a group of holding registers would have the following function code:

0000 0011 (Hexadecimal 03)

1.8. What is a function code?

The second byte sent by the Master is the Function code. This number tells the slave which table to access and whether to read from or write to the table.

Function Code	Action	Table Name
01 (01 hex)	Read	Discrete Output Coils
05 (05 hex)	Write single	Discrete Output Coil
15 (0F hex)	Write multiple	Discrete Output Coils
02 (02 hex)	Read	Discrete Input Contacts
04 (04 hex)	Read	Analog Input Registers
03 (03 hex)	Read	Analog Output Holding Registers
06 (06 hex)	Write single	Analog Output Holding Register
16 (10 hex)	Write multiple	Analog Output Holding Registers

1.9. Modbus “Registers”

Are just data values in the slave (server).

If you are writing a slave, it's up to you where the data is kept in the slave. You might for example have several arrays of data and simply store the data in there. The “registers” are just part of your program. The Modbus protocol describes what the data should look like when it goes out on the wire. It doesn't tell you how to write your program.

A client (master) sends a request to a server (slave). For example, if a client sends a request for function 2 with a quantity of 1 and an address of 5, the server will respond with the value of whatever was in the memory location it calls “discrete input 5”.

The register locations don't even necessarily have to exist. Suppose for example you are making a very simple server (slave) device that acts as an input device with 6 inputs. If we take the above example (function 2, quantity 1, address 5), then the server simply has to read the state of the input and send an appropriate reply to the client. As long as the client gets the reply it was expecting, it's happy.

If you have a server with a large register map (data table), then it can be simpler to implement it as an array (or several arrays) of data. The communications routines then just have to read the appropriate array locations to get the data they need. You can overlap these arrays if you wish so that for example coils are stored in holding registers, or holding registers are the same as input registers. Or, you can make them all separate.

Another way of putting this is that normally a server (slave) is something that performs a job, and the client (master) is something that asks for the job to be done. Modbus is simply the language that both parties use to talk to each other. How the job actually gets done is up to the server.

1.10. Exception Errors

If an error occurs, standard Modbus exception codes are returned in the Modbus packet. The following table, reprinted from the *Modicon Modbus Protocol Reference Guide*, shows the Modbus exception codes.

Code	Name	Meaning
01	ILLEGAL FUNCTION	The function code received in the query is not an allowable action for the slave.
02	ILLEGAL DATA ADDRESS	The data address received in the query is not an allowable address for the slave.
03	ILLEGAL DATA VALUE	A value contained in the query data field is not an allowable value for the slave.
04	SLAVE DEVICE FAILURE	An unrecoverable error occurred while the slave was attempting to perform the requested action.
05	ACKNOWLEDGE	The slave has accepted the request and is processing it, but a long duration of time will be required to do so. This response is returned to prevent a time-out error from occurring in the master. The master can next issue a Poll Program Complete message to determine if processing is completed.
06	SLAVE DEVICE BUSY	The slave is engaged in processing a long-duration program command. The master should retransmit the message later when the slave is free.
07	NEGATIVE ACKNOWLEDGE	The slave cannot perform the program function received in the query. This code is returned for an unsuccessful programming request using function code 13 or 14 decimal. The master should request diagnostic or error information from the slave.
08	MEMORY PARITY ERROR	The slave attempted to read extended memory, but detected a parity error in the memory. The master can retry the request, but service may be required on the slave device.

1.11. What is a Modbus Map?

A modbus map is simply a list for a slave device that defines

- what the data is (eg. pressure or temperature readings)
- where the data is stored (which tables and data addresses)
- how the data is stored (data types, byte and word ordering)

Additional information on the MODBUS Protocol can be found at:

<http://www.simplymodbus.ca/index.html>

Chapter - 2. MCS-MODBUS-IO-12 Communication

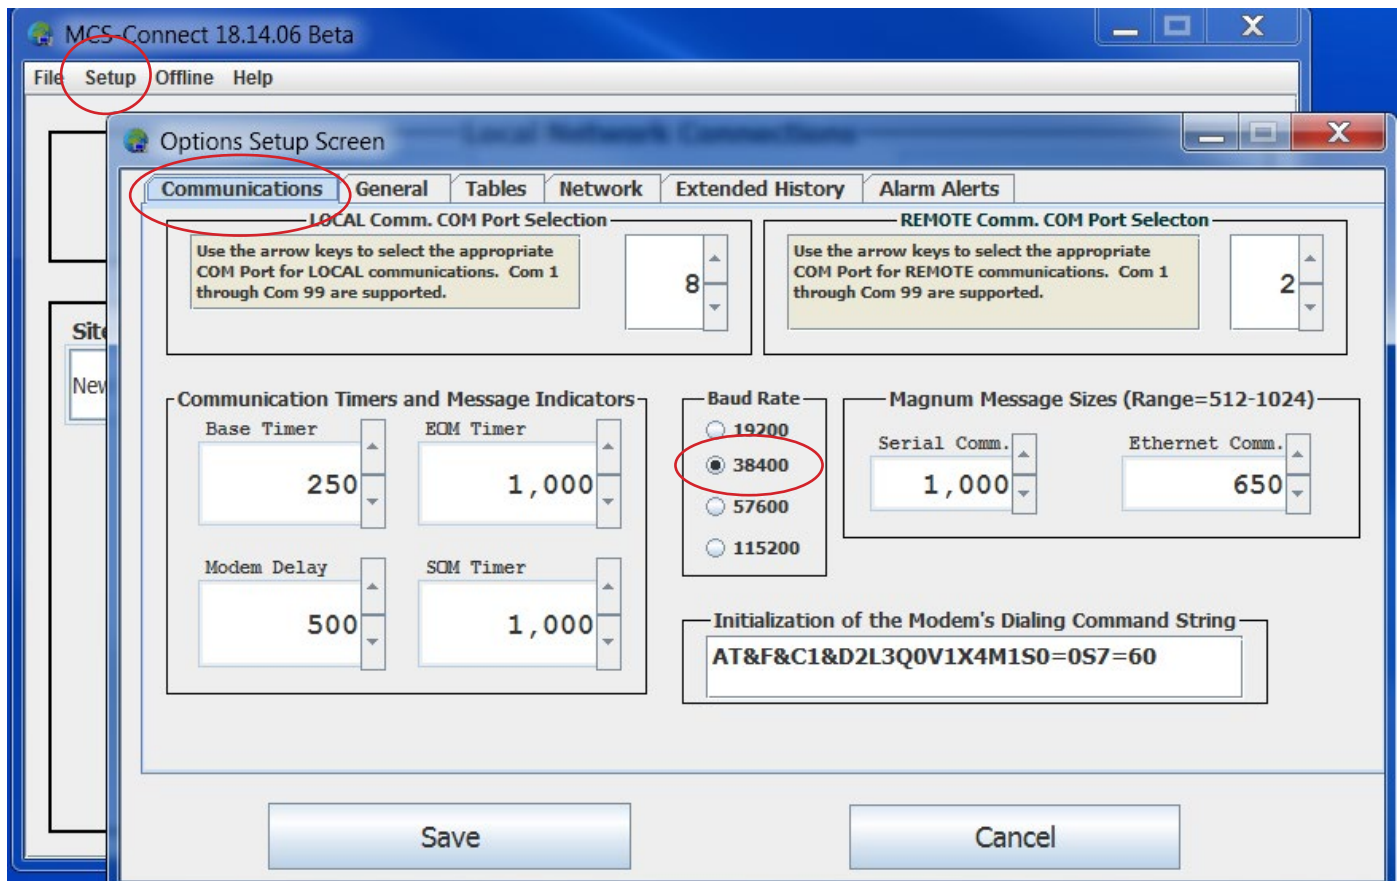

2.1. Communicating with MCS-CONNECT

Follow the steps below to wire and setup communication with the MODBUS BOARD.

1. Use a MCS-USB-485 cable to connect from your PC to the MCS-MODBUS-IO-12.
2. Connect the RS485 to the MCS-MODBUS-IO-12
3. Connect the USB cable to your PC
4. Start MCS-CONNECT

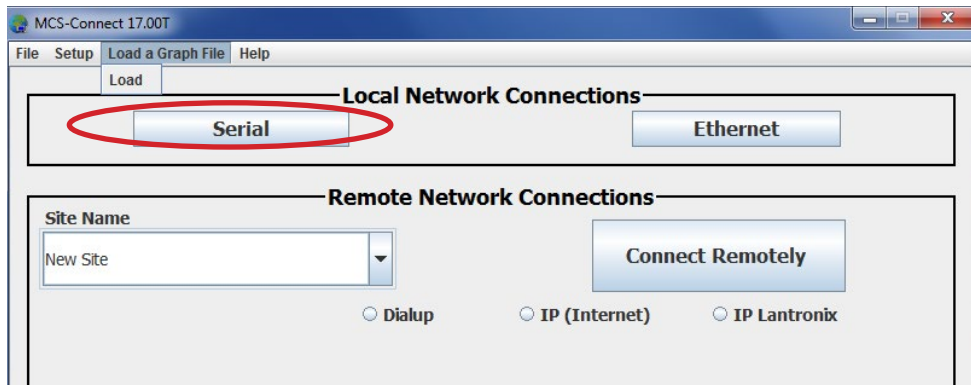

5. Click on Setup at the top menu tab in MCS-CONNECT

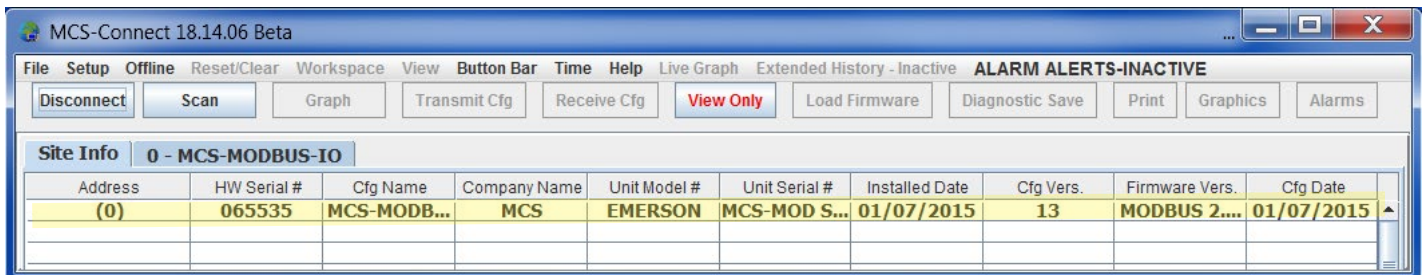

6. On the communication screen, ensure your LOCAL Comm COM Port Selection is set up to the correct port. Change the Baud Rate to 38400.
7. Click Save once you have made your changes.

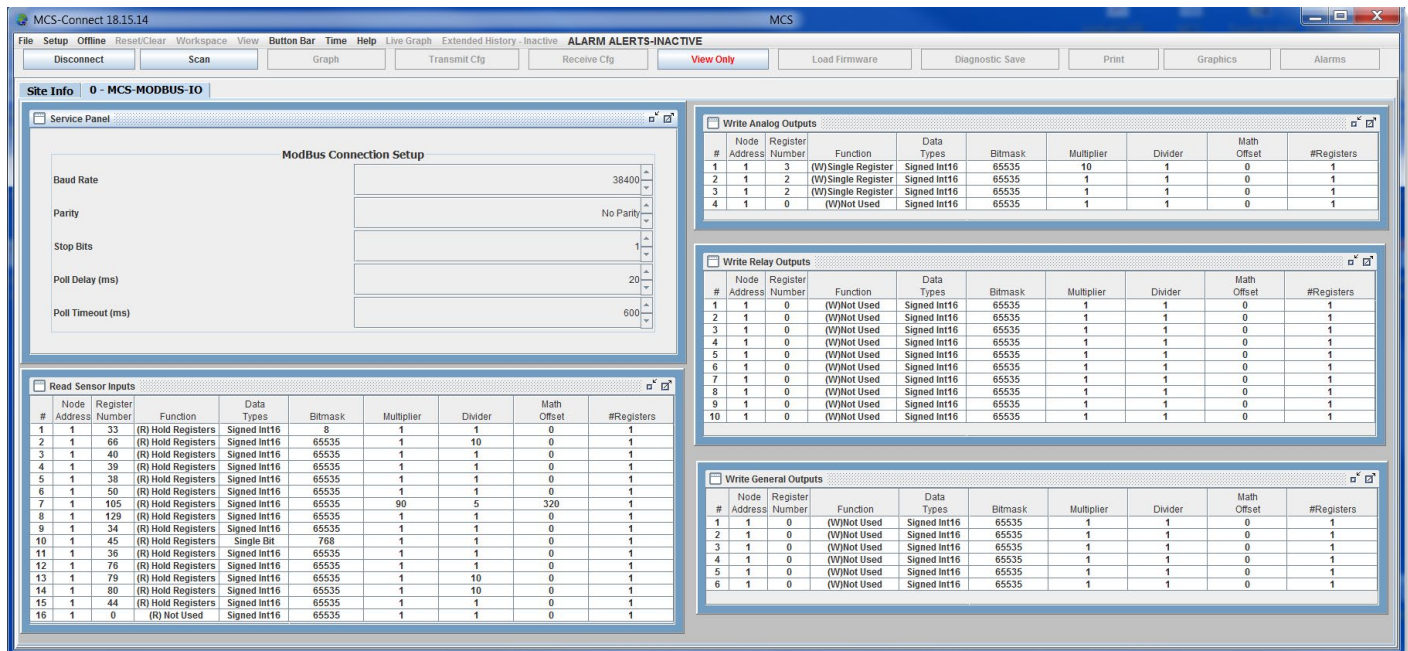

8. Back in the main screen, click Serial.

9. Once the MCS-MODBUS-IO shows up, click on the MCS-MODBUS-IO-12 unit.

10. Next Screen shows the Status of the MCS-MODBUS and its various Screens

Chapter - 3. Program Type Preprogram Select Settings

The MCS-MODBUS-IO-12 has pre-defined configurations that are field selectable via the PROGRAM TYPE dials, up to 99 different slave devices, **one Modbus per slave**. Eleven (15 slave devices have been pre-programmed into the firmware for common slave devices as shown in the chart below. Number 17-99 are reserved for future use as we program them into the Modbus firmware.

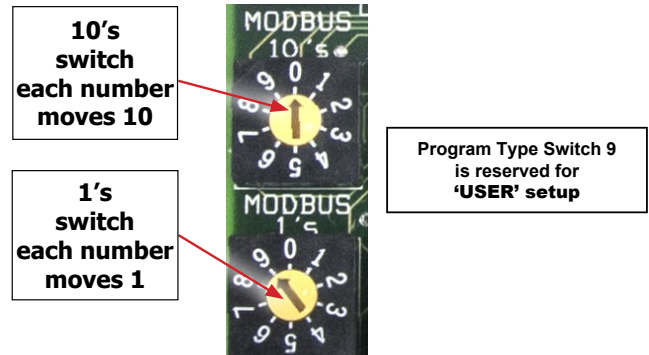

*** Number 9** has been set aside for **'USERS'** to setup custom configurations for slave devices that have not been pre-programmed.

To set the number '0' start with the bottom switch marked 'MODBUS 1's' and set the switch to '0'.

Example: to dial 11, set bottom switch marked 'MODBUS 1's' to '1' and top switch marked 'MODBUS 10's' to '1'.

NOTE: PROGRAM SELECT '0' - YASKAWA VFD A1000

PROGRAM SELECT CHART	
PROGRAM SELECT	CONFIGURATION NAME
0	YASKAWA VFD A1000-HARDWIRED / MODBUS

Chapter - 4. USER Custom Programming Switch '9'

4.1. SETTING UP CUSTOM PROGRAM FOR YOUR DEVICE

1. Set the 'PROGRAM SELECT SWITCH' to '9' on the MCS-MODBUS-IO-12.
2. Start MCS-CONNECT version 18.00 or higher.
3. At the startup screen, Click on the 'OFFLINE' menu bar as shown below.
4. Click on 'Load an Offline MODBUS .cfg File that you created or was send to you for your device.
5. Search on your computer for your MODBUS .cfg file

4.1.1 Data Input

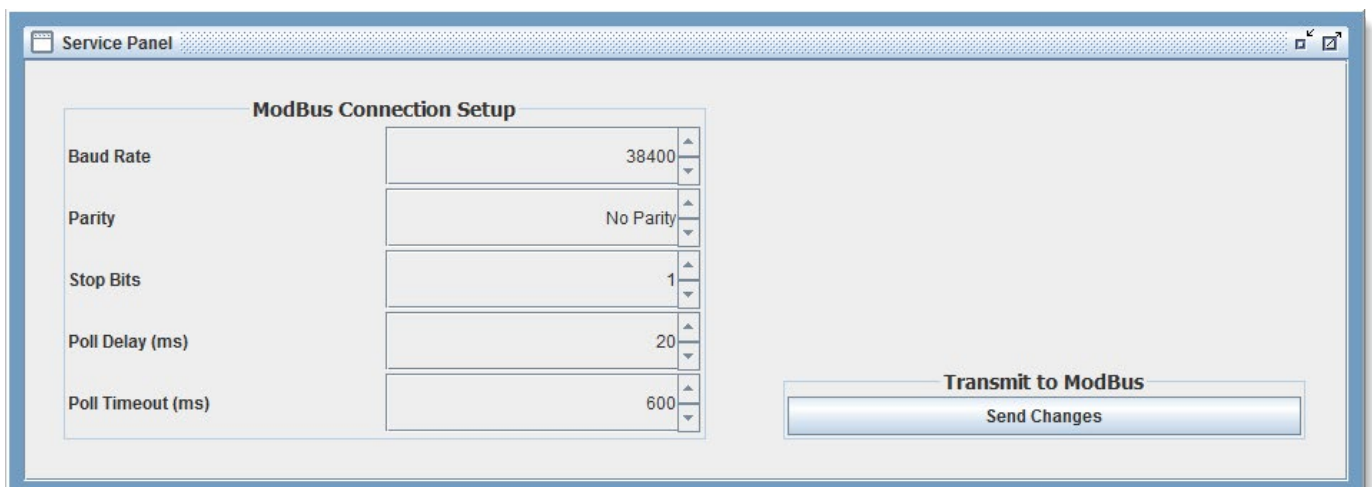

When MSC-Connect opens, the screen will display the following five block windows:

The information concerning the 'Registers' that you want to read or write to comes from the manufacture of the slave device.

NOTE: Some manufactures show the number as a hex number: example 21H. When converted to a decimal number, it would be shown in MCS-CONNECT as 33 as the 'REGISTER NUMBER'.

4.1.2 Service Panel-MODBUS CONNECTION SETUP - MCS-CONNECT

This window block is to setup the MCS-MODBUS-IO-12 communication port parameters for the slave devices.

Refer to your slave device User Manual for details about the correct values to setup the communication port.

- **Baud Rate:** In this field enter the Device communication Baud Rate.
- **Parity bit:** In this field enter the Device communication Parity Bit.
- **Stop Bit:** In this field enter the Device communication Stop Bit.
- **Poll Delay (ms):** This is for future use and is not yet implemented.
- **Poll Timeout (ms):** This is for future use and is not yet implemented.

4.1.3 Read Sensor Inputs

This window block is to configure the following ModBus options:

#	Node Address	Register Number	Function	Data Type	Bitmask	Multiplier	Divider	Math Offset	#Registers
1	1	33	(R) Hold Registers	Not Used	8	1	1	0	1
2	1	66	(R) Hold Registers	Not Used	65535	1	10	0	1
3	1	40	(R) Hold Registers	Not Used	65535	1	1	0	1
4	1	39	(R) Hold Registers	Not Used	65535	1	1	0	1
5	1	38	(R) Hold Registers	Not Used	65535	1	1	0	1
6	1	50	(R) Hold Registers	Not Used	65535	1	1	0	1
7	1	105	(R) Hold Registers	Not Used	65535	90	5	320	1
8	1	129	(R) Hold Registers	Not Used	65535	1	1	0	1
9	1	34	(R) Hold Registers	Not Used	65535	1	1	0	1
10	1	45	(R) Hold Registers	Single Bit	768	1	1	0	1
11	1	36	(R) Hold Registers	Not Used	65535	1	1	0	1
12	1	76	(R) Hold Registers	Not Used	65535	1	1	0	1
13	1	79	(R) Hold Registers	Not Used	65535	1	10	0	1
14	1	80	(R) Hold Registers	Not Used	65535	1	10	0	1
15	1	44	(R) Hold Registers	Not Used	65535	1	1	0	1
16	1	0	(R) Not Used	Not Used	65535	1	1	0	1

- **Node Address (Slave Address):** In this column enter the Device slave address that identifies the specific device in the network.
- **Register Number (Data Address):** In this column enter the register address that you need to read to.
- **Function (Function Code):** in this column you will find the following options:
 - Read Single Coil: Read Discrete Output Coils.
 - Read Single Register: Read Analog Output Holding Registers.
 - Read input Register: Read Analog Output Registers.

- **Data type:** In this column you will find the following options:
 Some devices support 32 bit floating point values that are encoded according to IEEE Standard 754. Those devices required two 16-bit addresses to hold a 32-bit float value. In this case it is also necessary to select 2 registers in the #Register column.

- **Bitmask** The Bitmask is used to easily check the state of individual bits regardless of the other bits.

Example: Let use the Drive Status (U1-12 Register) of the VFD YASKAWA AC Drive-A1000 HHP

No. (Addr. Hex)	Name	Description	Analog Output Level
U1-12 (4B)	Drive Status	<p>All Modes</p> <p>Verifies the drive operation status.</p> <p>U1 - 12 = 00000000</p>	No signal output available

In this example let say that we want to know if the Driver is running (bit 0), also we want to check for fault detection (bit 8). The bit mask in binary should look like this 10000001, this value has to be converted to hex to enter the value in the Bitmask column, so the value to be entered will be 0x81.

- **Multiplier:** This value is used to display the value with the decimal place moved to the right.
- **Divider:** This value is used to display the value with the decimal place moved to the left.
- **Math offset:** use this value if an offset is need to display the adjusted value.
- **#Register:** enter the number of consecutive registers that you want to read.

4.1.4 Write Analog Outputs

#	Node Address	Register Number	Function	Special	Bitmask	Multiplier	Divider	Math Offset	#Registers
1	1	3	(W)Single Register	Not Used	65535	10	1	0	1
2	1	0	(W)Not Used	Not Used	65535	1	1	0	1
3	1	0	(W)Not Used	Not Used	65535	1	1	0	1
4	1	0	(W)Not Used	Not Used	65535	1	1	0	1

This window block is to configure the following ModBus options:

- **Node Address** (Slave Address): In this column enter the Device slave address that identifies the specific device in the network.
- **Register Number** (Data Address): In this column enter the register address that you need to write to.
- **Function** (Function Code): in this column you will find the following options:
 - Write Single Register: Write Analog Output Holding Registers.
 - Write Multi Register: Write Analog Output Registers.
- **Data Type:** Not Available for Write Registers
- **Bitmask:** The Bitmask is used to easily change the state of individual bits regardless of the other bits.
- **Multiplier:** This value is used to display the value with the decimal place moved to the right
- **Divider:** This value is used to display the value with the decimal place moved to the left
- **Math offset:** use this value if an offset is need to display the adjusted value
- **#Register:** enter the number of consecutive registers that you want to write

4.1.5 Write Relay Outputs

#	Node Address	Register Number	Function	Special	Bitmask	Multiplier	Divider	Math Offset	#Registers
1	1	2	(W)Single Register	Not Used	65535	1	1	0	1
2	1	0	(W)Not Used	Not Used	65535	1	1	0	1
3	1	0	(W)Not Used	Not Used	65535	1	1	0	1
4	1	0	(W)Not Used	Not Used	65535	1	1	0	1
5	1	0	(W)Not Used	Not Used	65535	1	1	0	1
6	1	0	(W)Not Used	Not Used	65535	1	1	0	1
7	1	0	(W)Not Used	Not Used	65535	1	1	0	1
8	1	0	(W)Not Used	Not Used	65535	1	1	0	1
9	1	0	(W)Not Used	Not Used	65535	1	1	0	1
10	1	0	(W)Not Used	Not Used	65535	1	1	0	1

This window block is to configure the following ModBus options:

- **Node Address** (Slave Address): In this column enter the Device slave address that identifies the specific device on the network.
- **Register Number** (Data Address): In this column enter the register address that you need to write to.
- **Function** (Function Code): in this column you will find the following options:

- Write Single Coil: Write Analog Output Holding Registers.
- Write Multi Register: Write Analog Output Registers.
- **Data Type:** Not Available for Write Registers
- **Bitmask** The Bitmask is used to easily change the state of individual bits regardless of the other bits.
- **Multiplier:** This value is used to display the value with the decimal place moved to the right
- **Divider:** This value is used to display the value with the decimal place moved to the left
- **Math offset:** use this value if an offset is needed to display the adjusted value
- **#Register:** enter the number of consecutive registers that you want to write

4.1.6 Write General Outputs

#	Node Address	Register Number	Function	Special	Bitmask	Multiplier	Divider	Math Offset	#Registers
1	1	0	(W)Not Used	Not Used	65535	1	1	0	1
2	1	0	(W)Not Used	Not Used	65535	1	1	0	1
3	1	0	(W)Not Used	Not Used	65535	1	1	0	1
4	1	0	(W)Not Used	Not Used	65535	1	1	0	1
5	1	0	(W)Not Used	Not Used	65535	1	1	0	1
6	1	0	(W)Not Used	Not Used	65535	1	1	0	1

This block window is for future use and is not yet implemented.

For more information about MODBUS communication refer to <http://www.simplymodbus.ca>

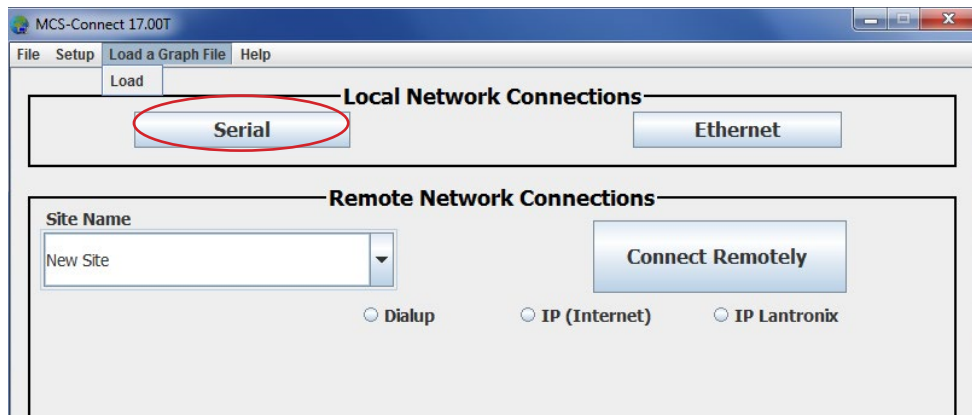

4.1.7 Once you have completed the 'USER CUSTOM SETUP'

Click 'SAVE CHANGES' which will save the MODBUS .cfg file to your computer hard drive.

4.1.8 LOAD THE NEW .CFG FILE TO YOUR MODBUS

1. Back in the main screen, click Serial.
2. Scan for your MODBUS controller.

3. Once the MCS-MODBUS-IO loads, click on the MCS-MODBUS-IO-12 unit.

4. Click 'TRANSMIT CFG' to load your new config file for the 'USER' (9) setting on the MCS-MODBUS'
5. **IMPORTANT** - Make sure you set your program select switch to the number '9' position.

Chapter - 5. MCS-MAGNUM - Modbus Typical Network

5.1. A typical network layout will consist of the MASTER and slaves.

Below is a diagram showing an MCS-MAGNUM (master) communicating with an MCS-RO-BASE/EXT, MCS-SI-BASE/EXT expansion boards, and two MCS-MODBUS-IO-12 Boards over the MCS I/O network.

The MCS-MODBUS-IO-12 performs like a MCS-RO and MCS-SI to the MCS-MAGNUM. This allows the MCS-MAGNUM to control 10 relays, 4 analog outputs and read 16 sensors.

The master, MCS-MAGNUM uses the MODBUS RTU protocol to communicate with the two slave devices, 'YASKAWA A1000' (pre-defined in MCS-Modbus #1) and Rhymebus Vfd (pre-defined in MCS-Modbus #2) as shown in the example.

The MCS-MODBUS-IO-12 has configurations for these slave devices that are field selectable via the PROGRAM TYPE dial.

The MCS-MAGNUM is programmed to check the pre-determined 'registers' of these slave devices and through the MCS-MODBUS can read and write to them.

Chapter - 6. MCS-MODBUS-IO-12 BOARD

The **MCS-MODBUS-IO-12** gives the MCS-MAGNUM the ability to act as a Modbus Master using the Modbus RTU Protocol. This allows the **MCS-MAGNUM** to communicate to Modbus slave devices (such as Variable Frequency Drives, Compressors, etc.) to send and access parameters.

The MCS-MODBUS-IO-12 performs like a **MCS-RO** and **MCS-SI** to the MCS-MAGNUM. This allows the MCS-MAGNUM to control 10 relays, 4 analog outputs and read 16 sensors.

Chapter - 7. Wiring Diagrams

7.1. Wiring MCS-MAGNUM I/O for communicating

MCS-MAGNUM I/O Communication to MCS-MODBUS. Communicating from MCS-MAGNUM to PC using a MCS-USB-485 cable.

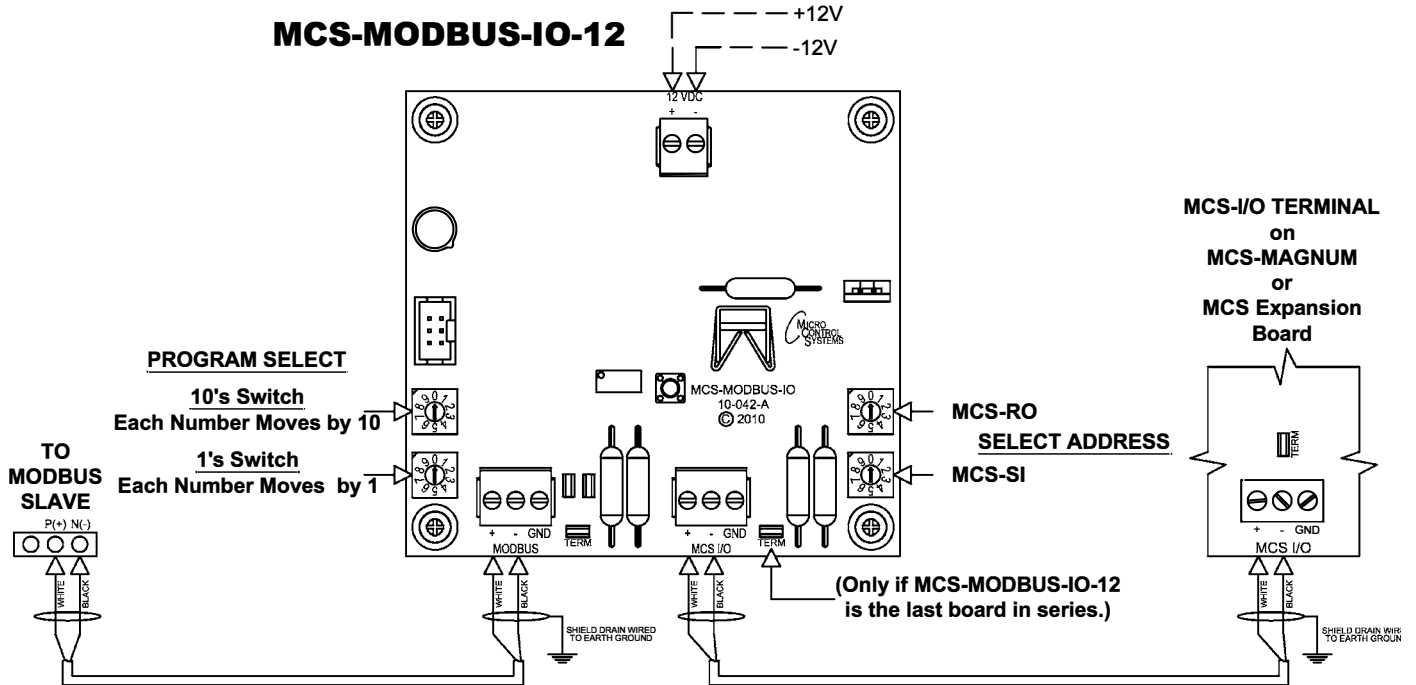

For communication to PC, use a MCS-USB-RS485 CABLE to USB port on PC.

7.2. Wiring to MCS-MAGNUM with MCS Expansion Board

MCS-MODBUS-IO-12

8.2.6 TURBOCOR Setup for MCS-Modbus I/O

Below are the parameters that can be setup using the Turbocor communicating to the MCS-MODBUS I/O.

See wiring for Turbocor to MCS-MODBUS next page.

The **Service Monitoring Tools Software** communicates with the compressor via the using the RS-432 connection at the Compressor I/O Board.

Communication requires a MCS-USB-RS432 cable for the computer.

JUMPER	FUNCTION AND SETUP
JP2	Modbus termination jumper: install the jumper if Modbus is used and if the Modbus connection is at the end of a run

8.2.6.1. How to Establish Communication

Data communication between a PC and the compressor I/O board can be established via a RS-432 cable connection using the **Service Monitoring Tool Software**.

RS-485 Data Communication

Setup the correct parameters for communicating with the MCS-MODBUS-IO-12:

1. Communication PROTOCOL with the compressor via RS485 using Modbus (RTU).
2. The Turbocor is connected using a 2-wire connector on J1 (communication port).
3. The termination should be set as per the drawing on the next page.
4. MODBUS RS-485 ADDRESS: **1**
5. RS-485 BAUD RATE: **38400**
6. NUMBER OF STOP BITS: **1**
7. PARITY: **NO**

8.3.10 DANFOSS VLT FC102 Wiring Diagram - To Modbus/MCS Expansion Boards/MCS-MAGNUM

Use terminal 37 as input for safe stop. In rare cases, control cables more than 100 m (330 ft) and analog signals result in 50/60 Hz earth loops due to noise from mains supply cables. If this situation occurs, break the screen or insert a 100 nF capacitor between screen and chassis. Connect the digital and analog in- and outputs separately to the frequency converter common inputs (terminal 20, 55, 39) to avoid earth currents affecting the system.

8.4. Bitzer CSVH Compressor Mapping - PROGRAM SELECT '4'

Modbus to MCS-CONNECT will show all available pre-programmed register readings.

8.4.6.2. Initial setup for communication from Bitzer to MCS-MODUS

Bitzer control module Lodam Frequency Converters(FC)

1. Communication PROTOCOL with the FC is via RS485 using Modbus (RTU).
2. The FC is connected using a 2-wire connector on COM1 (X07 communication port).
3. The termination should be set as per the drawing on the previous page
4. MODBUS ADDRESS: 1
5. BAUD RATE: 38400
6. NUMBER OF STOP BITS: 1
7. PARITY: **NO PARITY**

Status LED's
 After a power-up sequence is completed the green LED Operation should be On. If the yellow or the red LED is on, there is an alarm condition.

Communication LED's
 If the green COM1 LED is flashing, the Modbus communication is active.
 If the green COM2 LED is flashing, communication with LMT is active.

8.5.9 DANFOSS CDS 303 Wiring Diagram To Modbus/MCS Expansion Boards/MCS-MAGNUM

Use terminal 37 as input for safe stop. In rare cases, control cables more than 100 m (330 ft) and analog signals result in 50/60 Hz earth loops due to noise from mains supply cables. If this situation occurs, break the screen or insert a 100 nF capacitor between screen and chassis. Connect the digital and analog in- and outputs separately to the frequency converter common inputs (terminal 20, 55, 39) to avoid earth currents affecting the system.

8.6. Emerson CSD-100 Mapping - PROGRAM SELECT '6'

Modbus to MCS-CONNECT will show all available pre-programmed register readings.

8.7.6 MCS-POWERMETER Wiring Diagram To Modbus/MCS Expansion Boards/MCS-MAGNUM

A two wire plus shielded cable is connected between the MCS-MODBUS and the MCS-POWERMETER. Requires firmware 2.02I or better

RS-485 Connection from MCS-MODBUS

Address for MCS-POWERMETER and MCS-MODBUS

The address for I/O communication over the RS-485 protocol is set using the address switches located on the MCS-POWERMETER. The address must match that of the MCS-MODBUS that is communicating with it.

MSB SWITCH = 0

LSB SWITCH = 1

THE MCS-POWERMETER IS SHIPPED FROM MCS WITH THE DEFAULT ADDRESS SETTING OF 1 AS SHOWN ABOVE.

THE ADDRESS YOU USE MUST MATCH THE SETTING ON THE MCS-MODBUS.

8.8.8 Modbus write (1)

The screenshot shows a configuration window titled "AO MODBUS WRITE" for the variable "COMP SPEED". The window includes the following elements:

- Select Display Type:** A dropdown menu set to "RPM'S".
- Range:** A text field showing "(-32768 to 32767)".
- Logic:** A section labeled "If Relay-" with a dropdown set to "COMP" and the text "is Off, then Output =".
- Output Value:** A text field containing the value "0".
- Else:** A section with a "Value" field and a "Type" dropdown set to "SI".
- Min And Max:** Radio buttons for "YES" and "NO", with "NO" selected.
- Buttons:** "OK" and "Cancel" buttons at the bottom.

**ANALOG 1-1 - Modbus Write
'COMP SPEED'**

8.8.10 Ruking RELAY Outputs USER LOGIC (2)

RELAY 1-1 - USER LOGIC 'VFD CMP ON'

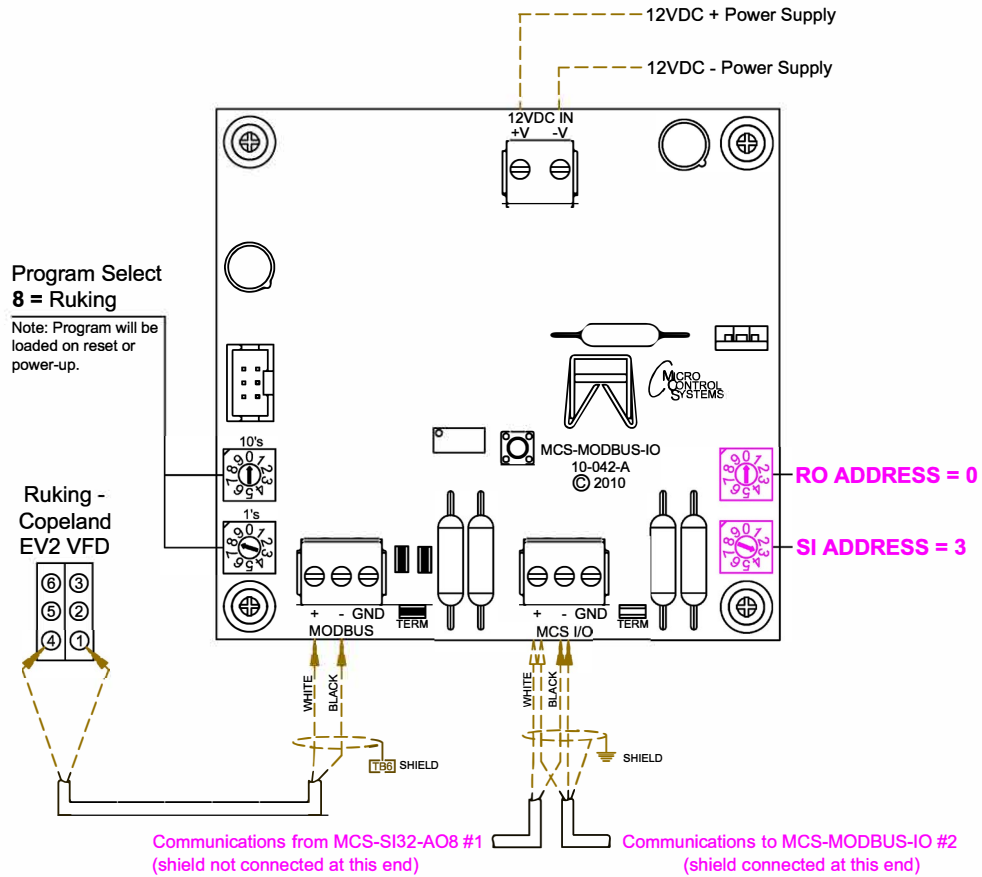

RELAY 2-1 - USER LOGIC 'VFD FanCtrl'

The 'VFD CMP ON' window shows logic where 'RO Value' is compared to 'None' using a 'COMP' operator. It includes settings for 'Limit #1' (Type: Fixed Value 0, Value: 0, ON/OFF: OFF) and 'Limit #2' (Type: Fixed Value 0, Value: 1, ON/OFF: ON). It also has fields for 'Delay Before ON', 'Pulse Count', 'Pulse Delay', and 'Delay Before OFF', all set to 0. The 'Store Alarm Msg when Relay turns On?' option is set to 'NO'.

The 'VfdFanCtrl' window shows logic where 'SI Value' is compared to 'Run/Stop' using a 'DI AND' operator. It includes settings for 'Limit #1' (Type: Stpt Nght Stbk, Value: VFD FAN ON, ON/OFF: OFF) and 'Limit #2' (Type: Setpoint Val, Value: VFD FAN ON, ON/OFF: ON). It also has fields for 'Delay Before ON', 'Pulse Count', 'Pulse Delay', and 'Delay Before OFF', all set to 0. The 'Store Alarm Msg when Relay turns On?' option is set to 'NO'.

Chapter - 9. Appendix - Transmit New Config

Transmitting a new Config File to the MODBUS I/O Board

1. Consult with factory for obtaining the latest MCS-CONFIG file for your MCS-MODBUS-IO-12 Board.
2. Download the file sent to you from the factory to a location on your PC hard drive.
3. BEFORE POWERING UP THE MODBUS BOARD, SET THE PROGRAM TYPE SELECTOR SWITCH TO "9" (USER).
4. Connect a MCS-USB-RS485 cable from your PC to the MCS I/O port on the MCS-MODBUS Board.
5. Click on MCS-CONNECT to start the program.
6. Click on setup, communications, and change the baud rate to 38400.
7. Click on the found MODBUS I/O board. Click on the view button and you will be prompted for a password, just click OK (You do not have to be authorized to make this change)
8. Click 'TRANSMIT CFG' button.
9. Select the new 'CONFIG' file you just downloaded on your PC and begin transmitting to the controller.
10. When the Transmit is complete, disconnect from the MODBUS I/O Board and re-connect the MODBUS I/O Board to the MAGNUM communications and the MODBUS device.

Receiving a Config File from the MODBUS I/O Board

1. Connect a MCS-USB-RS485 cable from your PC to the MCS I/O port on the MCS-MODBUS.
2. Click on MCS-CONNECT to start the program.
3. Click on setup, communications, and change the baud rate to 38400.
4. Click on the found MCS I/O board to "RECEIVE" the config file.
5. Click the 'RECEIVE CFG' button.
6. You are presented with a screen for naming the file and saving to a directory on your PC hard drive.

Revision/Disclaimer Page

Date	Author	Description of Changes
03-10-16	DEW	Build manual
07-19-16	DEW	Changes made to charts
8-12-16	DEW	Edits form Max, add Danfoss CDS 303 charts
11-2-16	DEW	Edit Mapping Charts
11-7-16	DEW	Add new Modbus photo, make edits
11-9-16	DEW	Edit from Max add how to transmit new firmware
02-01-17	DEW	Add Fault Sensors to Turbo appendix
02-07--17	DEW	Correct names for Program Select
06-08-17	DEW	Update Yaskawa and Danfoss 303 mapping
06-13-17	DEW	Updated Progam Select
06-20-17	DEW	Updated Mapping Slaves
06-22-17	DEW	add info on accessing modbus config from MCS-CONNECT 18.12.15
09-19-17	DEW	Changes from Brian, change Program Switch descriptions
10-10-19-17	DEW	Add screens for Modbus settings for slaves 0-12
11-01-17	DEW	Add Wiring drawing to Manual
11-27-17	DEW	Correct drawing for Turbocor jumper
12-01-11-17	DEW	Add startup instructions and configs to each slave
04-04-6-18	DEW	Complete adding user logics, etc., updates from Brian and Max
